PCM_permute

April 11, 2023

1 Permutation effects

```
[20]: import scipy as sp
import numpy as np
from matplotlib import pyplot as plt
```

```
[29]: data = sp.io.loadmat('coord1PHP.mat')
A = data['A']
coord = data['coord']
Nnode = A.shape[0]
plt.spy(A)
```

```
[29]: <matplotlib.image.AxesImage at 0x7fc8e8b04790>
```

```
[22]: Index = np.arange(Nnode)
      PermIndex = np.random.permutation(Nnode)
      PermMat = np.zeros((Nnode,Nnode))
```

```
[23]: for ind in Index:
      PermMat[Index[ind], PermIndex[ind]] = 1
```

A faster method could be

```
[24]: PermMat = sp.sparse.coo_matrix((np.ones(Nnode), (Index, PermIndex)),
      ↪shape=(Nnode, Nnode)).toarray()
```

```
[25]: A2 = PermMat.dot(A).dot(PermMat.T)
      plt.spy(A2)
```

```
[25]: <matplotlib.image.AxesImage at 0x7fc8e8d9c190>
```

We can invert the permutation effect

```
[26]: A3 = (PermMat.T).dot(A2).dot(PermMat)
      plt.spy(A3)
```

[26]: <matplotlib.image.AxesImage at 0x7fc8e8c082b0>

Let's try to visualize the 3d structure of the protein

```
[38]: fig = plt.figure()
      ax = fig.add_subplot(projection='3d')

      ax.plot(coord[:,0], coord[:,1], coord[:,2], marker='.')

```

[38]: [<mpl_toolkits.mplot3d.art3d.Line3D at 0x7fc8e19db5b0>]

ER_networks

April 11, 2023

1 Code from ER class

```
[57]: import scipy as sp
import numpy as np
import sys
import seaborn as sns
import matplotlib.pyplot as plt
import networkx as nx

def rand_canonical_f(Nnode, Plink):
    A = np.triu(np.random.rand(Nnode, Nnode), k=1)
    A = A > 1 - (2*Plink)
    A = A + A.T
    return A
```

Let's compare the memory usage between a sparse and a normal matrix. Moreover, we assume a microcanonical ensemble, fixing the number of nodes and links.

```
[58]: Nnode = int(1e3)
Nlink = int(3e4)
Net1 = sp.sparse.lil_matrix((Nnode,Nnode))
Net2 = np.zeros((Nnode,Nnode))

print(sys.getsizeof(Net1))
print(sys.getsizeof(Net2))
```

48
8000128

1.1 Microcanonical ensemble

Now, let's try to generate a random graph without using Networkx functions.

```
[59]: for index in range(100):
    # generate a random link
    ii = np.random.randint(Nnode, size=(Nlink, 2))
    # create a sparse matrix using these links
```

```

NetM = sp.sparse.coo_matrix((np.ones(Nlink), (ii[:,0], ii[:,1])),
↪shape=(Nnode, Nnode))
#remove loops
NetM.setdiag(0)
# symmetrize
NetM = NetM + NetM.T
print(NetM)

```

```

(999, 961)	1.0

NOTE that reciprocal links and repeated links randomly created reduce symmetric links with a probability that scales as $\frac{1}{N_{node}^2}$

Let's count the number of links in the matrix.

```
[60]: Nl = int(NetM.count_nonzero()/2)
print('Randomly generated links: {:d}'.format(Nl))
print('Missing links for microcanonical ensemble: {:d}'.format(Nlink-Nl))
```

Randomly generated links: 29035

Missing links for microcanonical ensemble: 965

We notice that we miss some links, then we add one by one missing links until microcanonical constraint fulfilled.

```
[61]: while Nl < Nlink:
    i1 = np.random.randint(Nnode)
    i2 = np.random.randint(Nnode)
    if i1 != i2 and NetM[i1,i2] == 0:
        NetM[i1,i2] = 1
        NetM[i2,i1] = 1 # symmetric link
        Nl += 1
```

Lastly, let's compute the degree vector, finding minimum and maximum.

```
[62]: K = sum(NetM)
print('Average degree: {:.2f}'.format(np.mean(K)))
print('Minimum degree: {:d}'.format(int(np.min(K))))
print('Maximum degree: {:d}'.format(int(np.max(K))))
```

Average degree: 61.87

Minimum degree: 39

Maximum degree: 87

1.2 Canonical ensemble

Let's now try to build a canonical ensemble.

```
[63]: Nnode = int(1e2)
      Plink = 0.3
      Nexp = int(1e4)
```

```
[64]: LinkS = np.zeros((Nexp, 1))
      for index in range(Nexp):
          NetC = sp.sparse.triu(sp.sparse.rand(Nnode, Nnode, density=Plink,
          ↪format='csr'), k=1)
          NetC = NetC + NetC.T
          LinkS[index] = NetC.count_nonzero()/2
```

Let's see some stats

```
[65]: print('Average number of links: {:.2f}'.format(np.mean(LinkS)))
      print('Standard deviation: {:.2f}'.format(np.std(LinkS)))

      print('Expected number of links: {:.2f}'.format(Plink*Nnode*(Nnode-1)/2))
      print('Expected standard deviation: {:.2f}'.format(np.
      ↪sqrt(Plink*(1-Plink)*Nnode*(Nnode-1)/2)))

      sns.histplot(data=LinkS, bins=30, kde=True)
```

```
Average number of links: 1485.08
Standard deviation: 23.30
Expected number of links: 1485.00
Expected standard deviation: 32.24
```

```
[65]: <Axes: ylabel='Count'>
```

The degree distribution for increasing size - CV decreases. Tends to the delta function - regular graph.

```
[66]: Pow = 4.21 # max network size
      Pl = 0.1
      Cnt = 0

      M = []
      S = []
      CV = []
      Nnodes = []

[67]: for index in np.arange(2, Pow, step=0.3):
      Nnodes.append(int(10**index))
      NetC = sp.sparse.triu(sp.sparse.rand(Nnodes[Cnt], Nnodes[Cnt], density=Pl,
      ↪format='csr'), k=1)
      NetC = NetC + NetC.T
      K = sum(NetC).todense()
      M.append(np.mean(K))
      S.append(np.std(K))
      CV.append(np.std(K)/np.mean(K))
